archestimator

The most intuitive way to work with cost estimates

FOUNDER
PHILIP JON ECHAVEZ LEWIS · UAP, PIA, INT'L ASSOC AIA

Teams waste time, effort, and money rebuilding proposal logic they should reuse.

The problem is not only calculation. It is wasting time.

LOST TIME → WASTED EFFORT → WASTED RESOURCES → **LOST MONEY**

Scattered files

Quote-heavy teams still build estimates from one-off sheets, copied templates, and scattered supplier files.

Lost pricing logic

Every project creates reusable pricing logic, but that knowledge disappears after the proposal is sent.

Manual rework

The result is slower offers, inconsistent line items, weak revision traceability, and repeated manual work.

Archestimator gives teams the tools to stop starting every estimate from zero.

One place to build estimates, reuse what already worked, and turn cost details into proposals clients can review.

BUILD
Create the estimate

→

REMEMBER
Keep the cost logic

→

SEND
Share the proposal

Less rebuilding

Teams stop starting from blank spreadsheets and copied files every time a new quote begins.

More reusable knowledge

Items, prices, suppliers, assumptions, and decisions can be carried forward instead of disappearing after one project.

Cleaner client decisions

Cost proposals can move from internal estimate to client comment, approval, or decline without losing the story behind the numbers.

Proposal work is where commercial knowledge should compound.

EVERY PROJECT ADDS

- Project 01
- Project 02
- Project 03

→

CAPTURED ONCE, REUSED EVERYWHERE

Cost knowledge layer

Scope, prices, suppliers, assumptions, revisions, and decisions stay connected instead of resetting per file.

Materials · Labor rates · Suppliers · Brands · Assemblies · Assumptions

→

SHARED WITH CLIENTS

Proposal review

COMMENT · APPROVE · DECLINE · REVISE

CLIENT DECISIONS FEED BACK INTO FUTURE ESTIMATES

Faster proposals

Teams reuse prior scope, pricing, and assumptions instead of rebuilding from scratch.

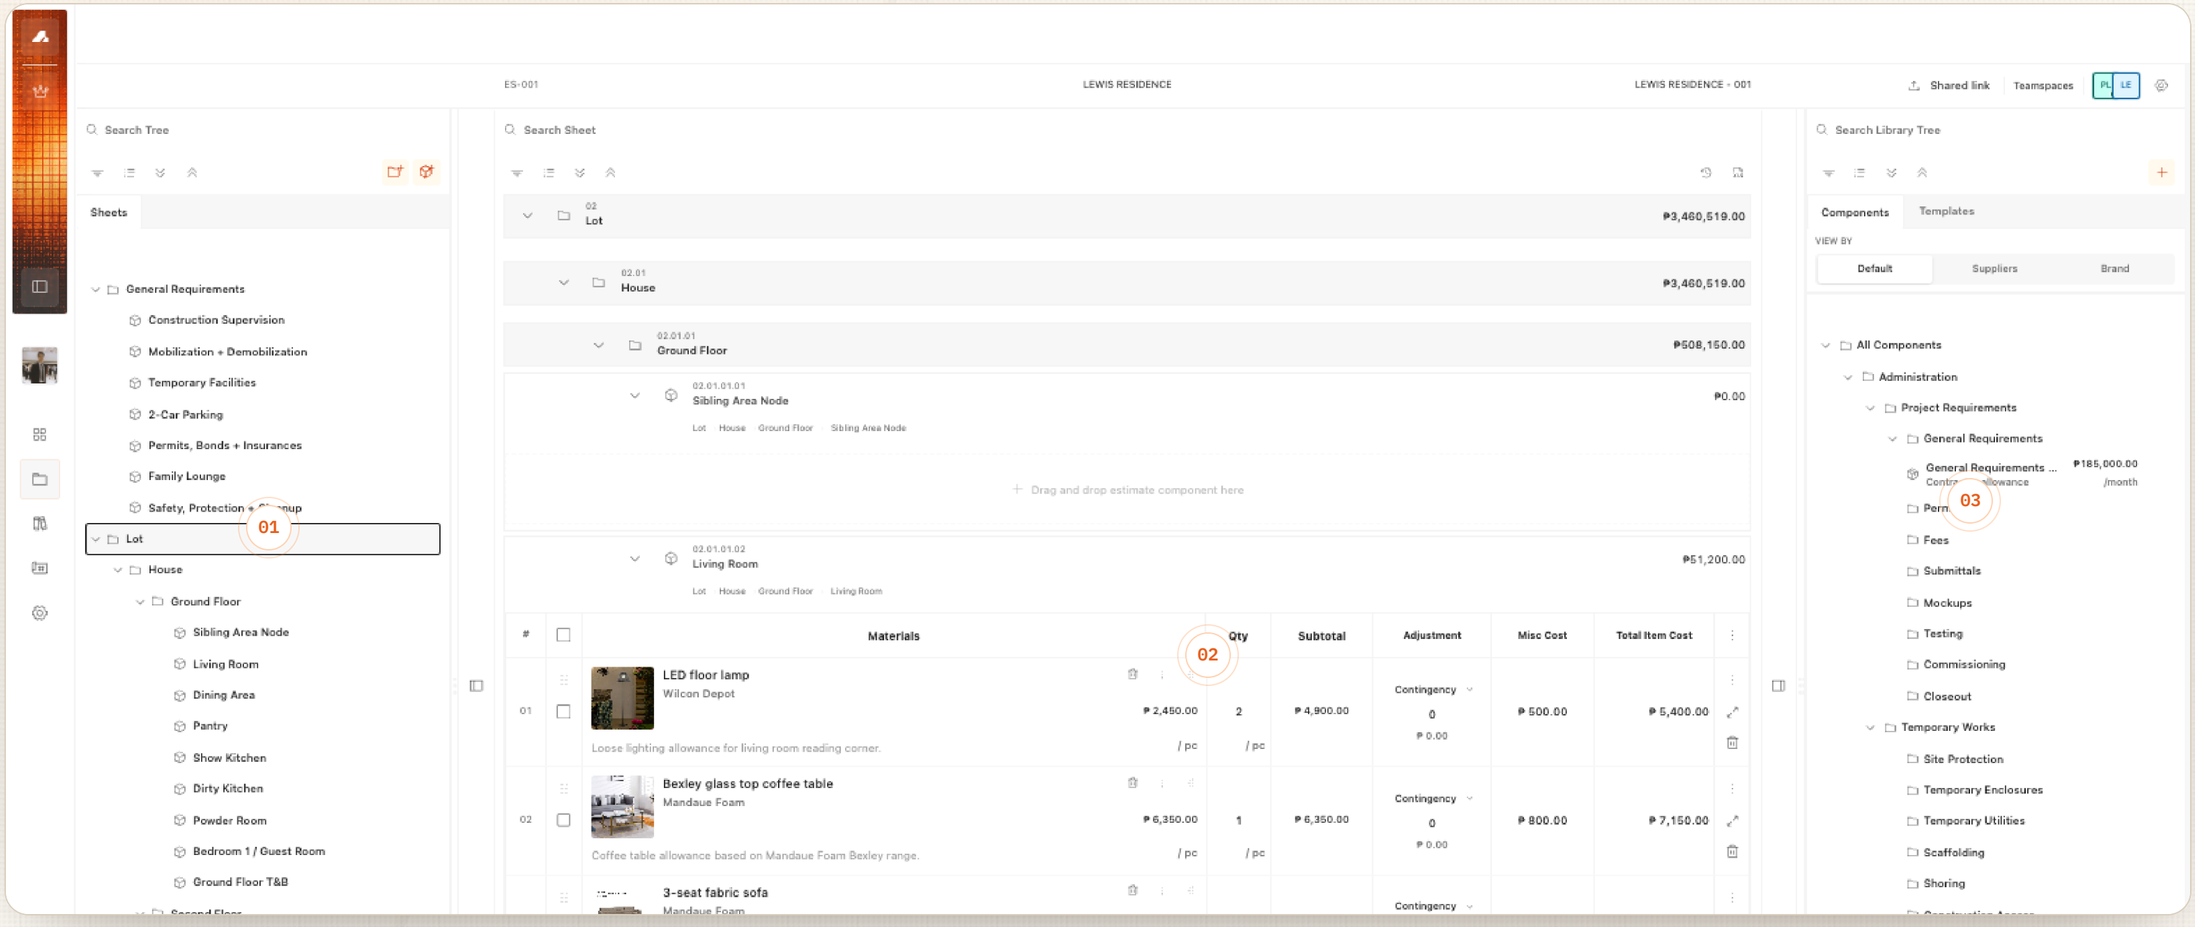

Clearer decisions

Clients review the offer with the context behind the numbers still attached.

Compounding memory

Every estimate and client response improves the next proposal workflow.

A structured workspace for estimates, reusable components, and proposal review.

01 Domain-driven tree
Scope stays organized by lot, house, floor, room, and package.

02 Estimate sheet
Quantities, adjustments, misc costs, and totals stay connected in one working surface.

03 Reusable library
Cost components stay ready to drag into estimates instead of being rebuilt.

Connected quote logic, from scope to client decision.

01
Opportunity
A new quote, estimate, or bid begins.

→

02
Scope
Organized by area, room, or package.

→

03
Catalog item
Pulled from reusable components.

→

04
Quote logic
Rates, suppliers, assumptions attached.

→

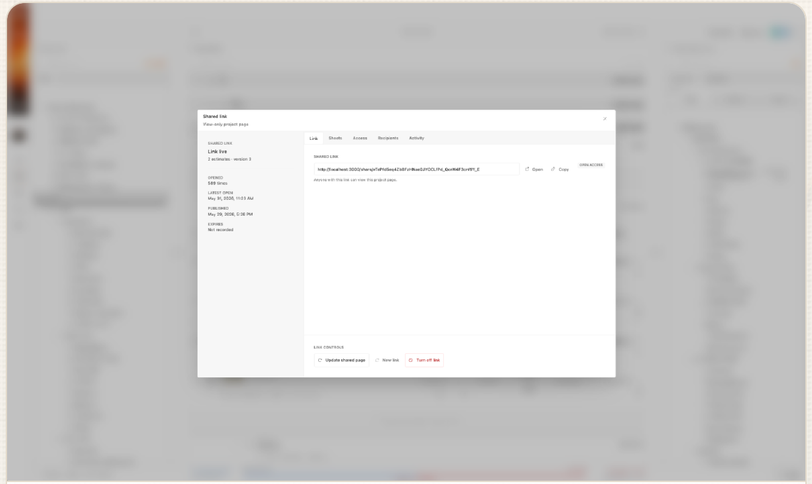

05
Revision
Changes tracked with context.

→

06
Proposal review
Client comments, approvals, export.

Every price belongs to a scope, a supplier context, and an assumption. Archestimator keeps those links intact, so the proposal never drifts from the detail behind it.

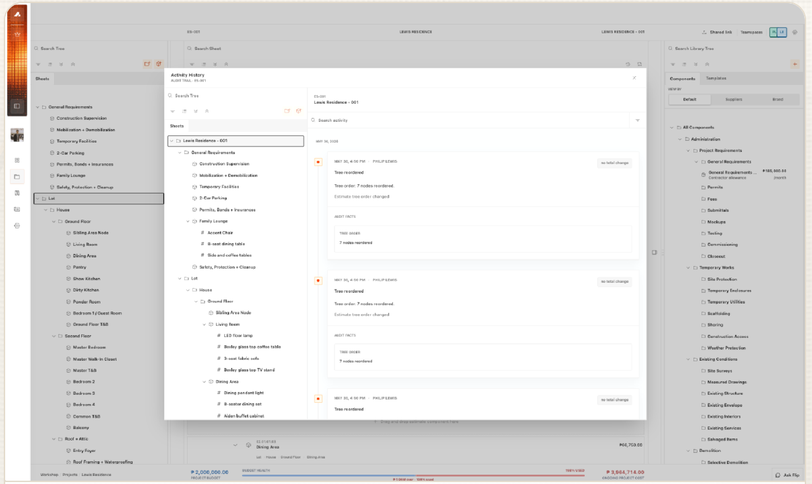

Teams work from one accountable source of truth.

SHARE

Live project links

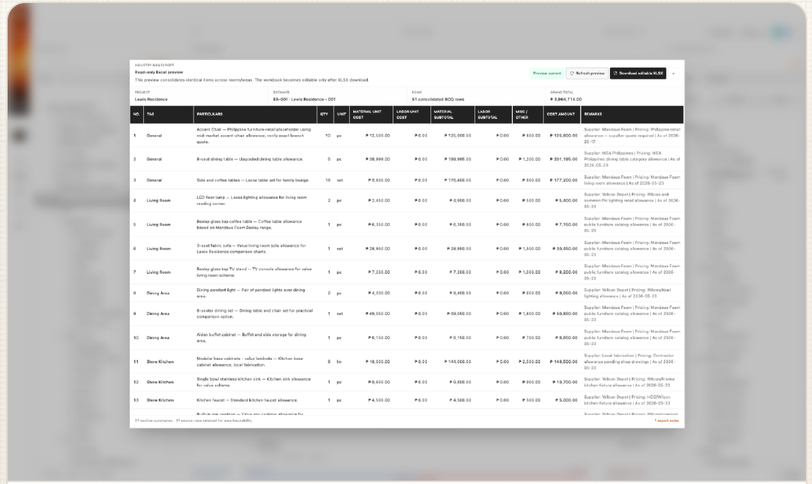

Distribute a view-only workspace link without sending another disconnected file.

TRACK

Audit facts

Tree changes, edits, and cost effects stay attributed instead of hiding in filenames.

EXPORT

Industry BOQ view

Domain-driven estimates collapse into a familiar Excel-ready schedule when the team needs it.

The proposal view turns review into a decision loop.

01 SHARE

Send a controlled proposal link.

The estimator chooses the estimate version, visible sheets, assumptions, and access rules before the client sees anything.

02 CLIENT REVIEW

Scope, totals, and alternates stay readable.

The client sees the proposal package, not the internal workspace, and can respond directly inside the review flow.

Client chooses the next move

COMMENT | APPROVE | DECLINE

03 RECORD

Decisions come back with context.

Comments, approvals, and declines attach to the proposal history so teams know what changed and why.

Controlled link
Client receives one proposal page.

Comment
Questions attach to the proposal instead of inbox threads.

Approve
Accepted scope becomes a clean decision record.

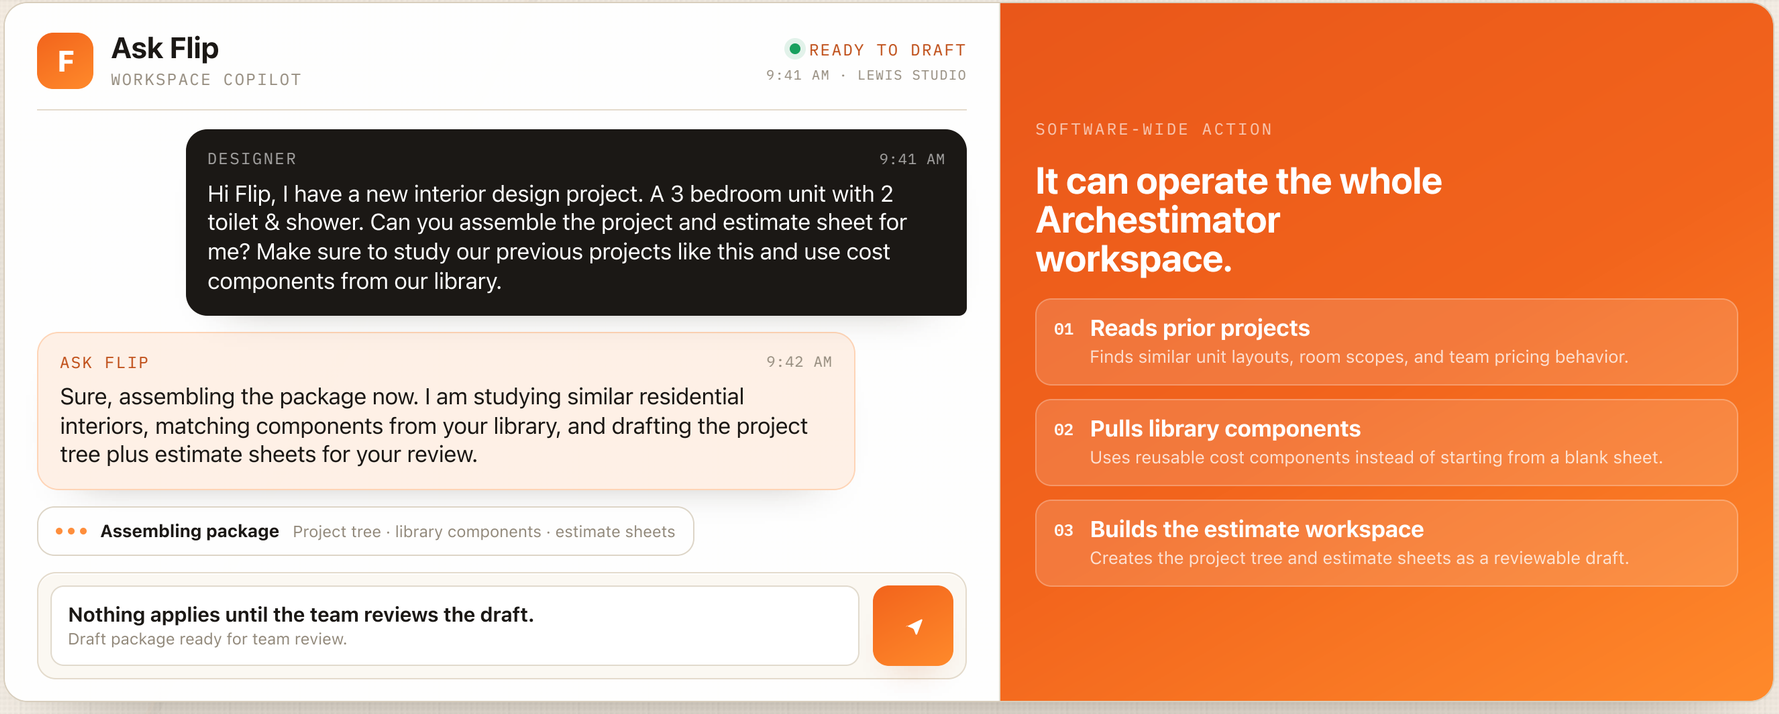

Decline
Rejected options still teach the next proposal.

Ask Flip turns one prompt into a reviewable estimate package.

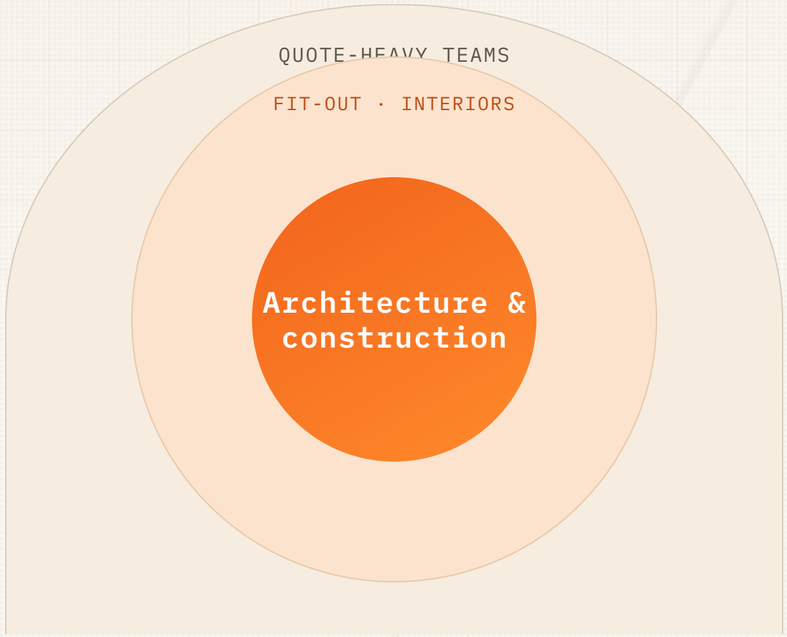

01 Studies your workspace
Reads prior projects, component library, pricing, suppliers, and estimate patterns.

02 Drafts project logic
Builds project trees and estimate sheets in the team's existing logic, then waits for review.

03 You review & apply
Nothing changes until accepted; applied work compounds into faster future proposals.

Construction estimation is the wedge. Quote-heavy teams are the opportunity.

MARKET THESIS

AEC is the wedge. Quote-first B2B is the platform.

We start where the pain is sharp and the founder has unfair context, then expand to any business that sells through scoped, itemized quotes before work begins.

01 BEACHHEAD

AEC first because fit is real.

Architecture, contractors, fit-out, design-build, and suppliers already live inside revision-heavy estimate workflows.

02 EXPANSION

The workflow is industry agnostic.

Reusable line items, approvals, proposal links, and audit history matter to every quote-first B2B team.

QUOTE-FIRST TEAMS BEYOND AEC

CUSTOM FABRICATION	EQUIPMENT SUPPLIERS	FACILITY SERVICES
INSTALLERS	AGENCIES	B2B SERVICES

Archestimator replaces disposable files with a compounding proposal system.

CURRENT DEFAULT

Spreadsheet chaos

- Flexible, but fragile
- Pricing logic resets per file
- Revisions live in filenames
- Proposal handoff is manual

ENTERPRISE ALTERNATIVE

Heavy systems

- Rigid setup and slow adoption
- Built around procurement, not proposals
- Too much process for early quote work
- Weak fit for nimble project teams

ARCHESTIMATOR WEDGE

Proposal-first cost intelligence

- Reusable cost components compound over time
- Version history makes accountability native
- Ask Flip drafts from the team's own data
- Client review connects comments, approvals, and declines to the estimate

Faster Reuse prior scope, items, pricing, and assumptions.

Clearer Every proposal line keeps its source context.

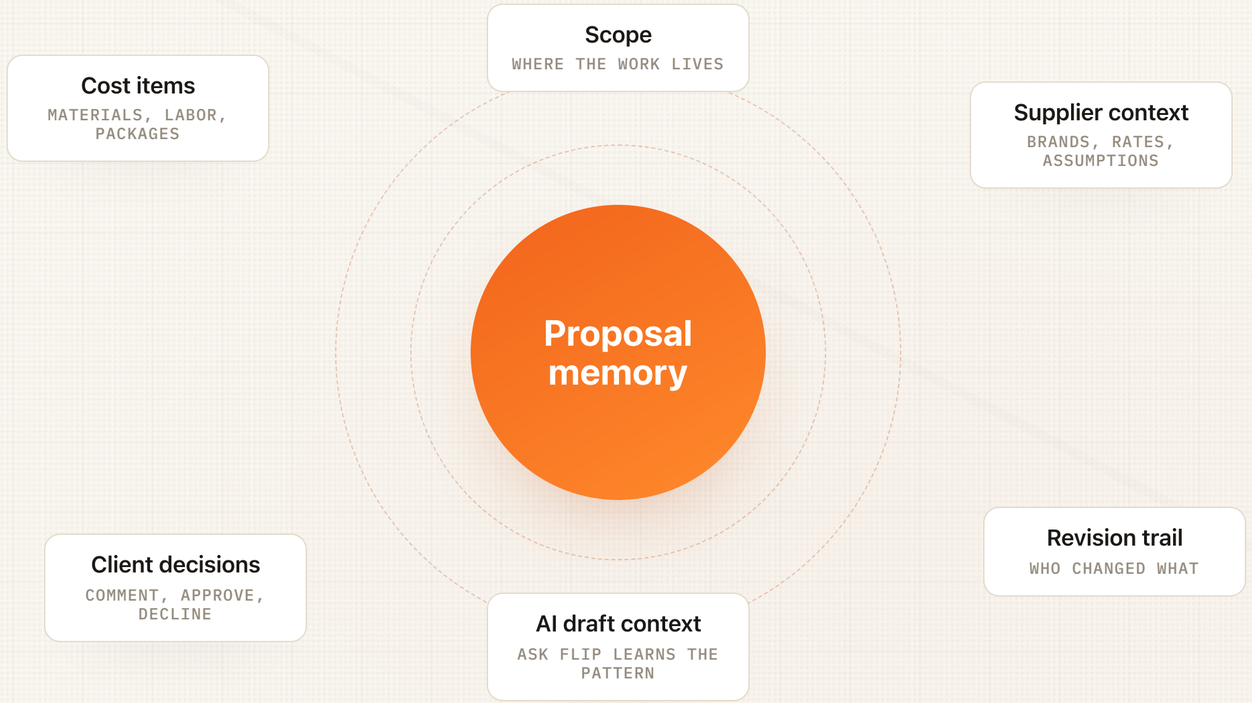

Safer Every change is attributed, versioned, and reversible.

Smarter Each estimate improves the next one.

The moat is the structured memory behind every proposal.

Archestimator is not trying to make spreadsheets prettier. It models how estimate work actually happens: scope, costs, suppliers, options, revisions, and decisions.

- Estimate trees
- Area & group
- Row items
- Assemblies
- Components
- Templates
- Version history

Every estimate can build a living picture of real costs.

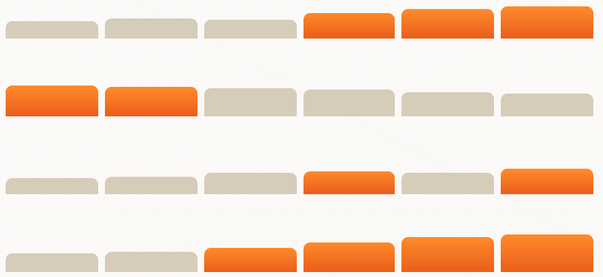

- As teams estimate, Archestimator captures structured, ground-level cost signals: materials, rates, suppliers, and assumptions over time.
- Aggregated and anonymized, those signals could show how real construction costs move before they appear in formal reports.
- That creates a long-term path toward benchmarking, research, and broader economic insight.

An emerging opportunity, to be explored responsibly after core product validation.
Not a current commercial claim.

GROUND-LEVEL COST SIGNALS

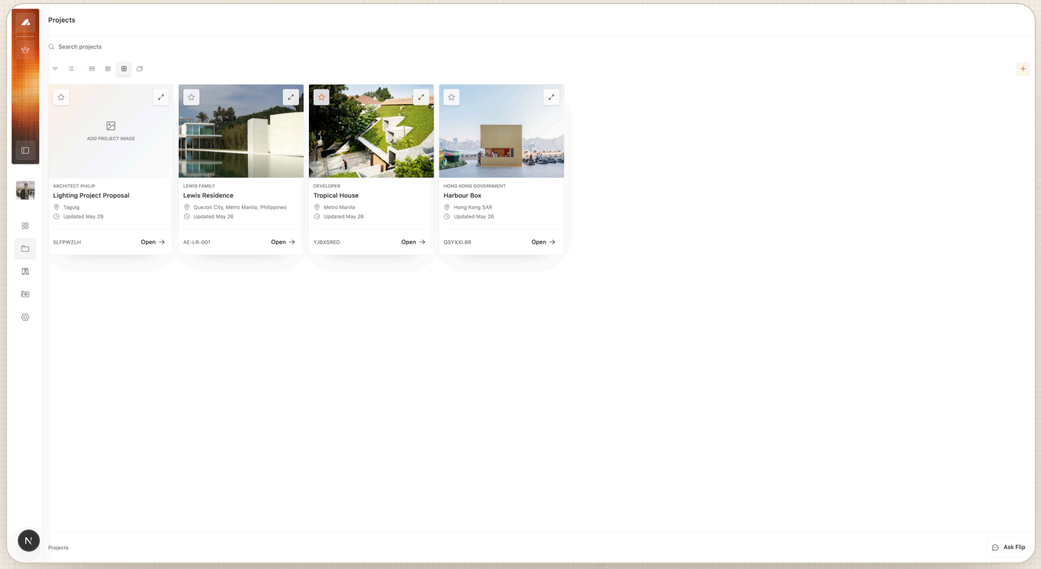

Anonymized

Illustrative category index

Illustrative only: shows the type of benchmark view that could emerge after validation and responsible aggregation.

Built enough to validate, early enough to shape with the right cohort.

WORKSPACE · SAMPLE PROJECTS

BUILT

- Estimate workspace

- Proposal comparisons (planned)

No formal customers, revenue, funding, or partnerships yet. Shown informally to peers and professional contacts.

A B2B SaaS model that expands from solo estimating into team proposal operations.

WHO PAYS

Quote-heavy professionals and businesses.

Initial buyers are solo architects, fit-out teams, contractors, design-build studios, suppliers, and small businesses that repeatedly produce itemized commercial offers.

WHY THEY PAY

Time saved becomes margin protected.

The value is not another file format. It is faster proposal prep, reusable pricing logic, fewer revision mistakes, clearer client decisions, and less senior time spent rebuilding estimates.

HOW IT EXPANDS

From one estimator to the whole proposal workflow.

Start with a workspace subscription, then expand through seats, shared libraries, proposal review, AI drafting, export workflows, and eventually analytics for larger business accounts.

ENTRY

Solo workspace

Single practitioner quote builder and reusable component library.

TEAM

Shared workspace

Seats, presence, version history, shared cost knowledge.

BUSINESS

Proposal operations

Client review, approvals, exports, templates, and handoff controls.

VALIDATION

Paid pilots first

No fixed prices claimed until willingness to pay and support burden are proven.

Solo founder velocity, structured validation, paid pilot proof.

SOLO BUILDER ADVANTAGE

Built by the person who lives the workflow.

Archestimator is still early, but the core product depth is already founder-built across architecture, software, design, and estimating practice.

- Licensed architect with direct proposal and supplier coordination experience.
- Software builder who can move product, UX, and technical infrastructure together.
- Founder-led access to the first users: architects, fit-out teams, contractors, and quote-heavy operators.

NEXT SIX MONTHS

01 SHIP

MVP ready for real jobs.

Stabilize onboarding, estimate editing, library reuse, proposal export, and basic QA.

02 VALIDATE

Founder-led beta learning.

Run discovery and beta teams to sharpen the ICP, onboarding path, and buyer language.

03 PROVE

Paid pilot evidence.

Convert early design partners into paid pilots with clear success criteria and pricing signals.

WHAT ACCELERATES THE NEXT STAGE

Cadence
Turn founder access into disciplined weekly validation.

Packaging
Shape a paid pilot offer before claiming broad pricing.

Introductions
Reach serious quote-first teams faster and learn deeper.

Philip Jon Echavez Lewis

LICENSED ARCHITECT · SOFTWARE ENGINEER · FOUNDER

I know the problem because I have lived it.
I know the market because I am the market.

A licensed architect who has prepared estimates and proposals, coordinated with suppliers and contractors, run his own practice, and worked in startup and technology roles.

After years in architecture, he chose to start over in software: learning new tools, moving outside his comfort zone, and building the discipline to translate domain experience into product execution.

That combination makes him the right founder-builder for Archestimator: he understands the messy estimating workflow, can design the product experience, and can ship the technical system himself.

> **He brings lived workflow, professional network, and technical execution into one founder.**

A bridge between architecture, software, design, and business.

archestimator

The most intuitive way to work with estimates

Archestimator gives quote-heavy teams one workspace to assemble estimates, reuse cost components, review proposals, and keep decisions connected. It replaces disposable spreadsheets with structured project memory: every line item, supplier note, revision, approval, export, and Ask Flip draft becomes context the next estimate can build on.
